TERMINAL: A DIFFERENT DOOR

Same machine: clicking icons or typing instructions.

SCAN & LEARN

WHAT HAPPENS • FOLLOW THE ARROWS

01 TYPE A COMMAND → 02 THE SHELL READS IT → 03 THE OS DOES WORK → 04 SEE THE RESULT

FOUR IDEAS TO KEEP

1 WHAT IS A TERMINAL?

An app where you type commands. The “shell” is the program interpreting them. They are not the same thing.

Window = terminal; interpreter = shell.

2 WINDOWS

Start → search “Terminal” or “PowerShell”. Windows Terminal can host PowerShell or Command Prompt; their commands may differ.

PowerShell: pwd (where am I?), ls (what is here?).

3 LINUX / macOS

Ubuntu: Ctrl+Alt+T or search Terminal. macOS: Spotlight → Terminal or Applications → Utilities.

In the terminal: pwd, ls, cd folder_name.

4 WHAT ABOUT ANDROID?

Android also has an OS and shell, but ordinary users do not get a standard built-in terminal app. Developers use special tools.

From a PC, ADB can open an Android shell; not needed yet.

TRY IT — PREDICT THE EFFECT

Teacher types “pwd” and “ls”. Students predict what appears before Enter is pressed.

THE ONE SENTENCE TO REMEMBER

GUI = SHOW what you want by clicking. TERMINAL = TYPE what you want.

Question: How are a terminal and a shell different?
