FROM TERMINAL TO SCREEN

A demonstration with ONE COMPUTER for an entire class.

SCAN & LEARN

WHAT HAPPENS • FOLLOW THE ARROWS

01 CREATE A FOLDER → 02 SEE IT IN THE GUI → 03 ADD A WEB PAGE → 04 OPEN IN BROWSER

FOUR IDEAS TO KEEP

1 1. CREATE SOMETHING VISIBLE

Open Terminal/PowerShell. Type “mkdir demo”. It makes a folder here. Type “cd demo”, then inspect the new folder using File Explorer / Files.

“pwd” shows the location; “ls” lists its contents.

2 2. WRITE A WEB PAGE

In the demo folder, create index.html using a plain-text editor. Type the exact code shown below; in Notepad choose “All files” when saving, not .txt.

<h1>Hello, world!</h1> → a large heading on screen.

3 3. MAKE IT APPEAR

Open index.html in your browser. Change “Hello” to “Welcome”, save, then reload. The code changed what you see!

A local HTML file works even without the internet.

4 4. OPTIONAL: LOCAL SERVER

If Python is installed, run a local server in the demo folder and open http://127.0.0.1:8000/. Stop it with Ctrl+C.

Windows: py -m http.server 8000 --bind 127.0.0.1
Linux/Mac: python3 -m http.server 8000 --bind 127.0.0.1

TRY IT — ONE-DEVICE CLASS DEMO

Before every Enter, ask: “What will change? Where can we see that change?”.

THE ONE SENTENCE TO REMEMBER

The TERMINAL can change files; the BROWSER can display those files as a page.

Caution: Python’s built-in server is for local demos, not production.
