ONE CLICK, MANY MACHINES

Follow a request from phone to data center and back.

SCAN / LEARN

THE SYSTEM AT A GLANCE

FOUR IDEAS THAT MATTER

1 REQUEST

Your browser asks for a page or an application result. A request is a structured message.

2 ENTRY POINT

A gateway receives the message. A load balancer may choose a healthy server with available capacity.

3 WORK

The selected service may read a cache, call another service or retrieve records from a database.

4 REPLY

The server sends data back. Your device renders the result and may save a temporary copy.

MEMORY HOOK

The click is local; the computation may travel across many computers.

DISCUSS WITHOUT COMPUTERS

If one service is slow, can the whole request become slow?
