# SECURITY & FAILURES

Keeping a service working is different from keeping its information safe.

SCAN / LEARN

## THE SYSTEM AT A GLANCE

## FOUR IDEAS THAT MATTER

### 1 AUTHENTICATION

Proves who or what is requesting access. Machines and people may have separate identities.

### 2 AUTHORIZATION

Decides which action that identity may perform. A reader should not automatically be a writer.

### 3 ISOLATION

Separate workloads, network zones and credentials limit what an incident can affect.

### 4 RESILIENCE

Monitoring, multiple copies and tested recovery reduce disruption, but none can prevent every failure.

## MEMORY HOOK

**Safe infrastructure asks two questions: Who are you? What are you allowed to do?**

## DISCUSS WITHOUT COMPUTERS

Can a service be online and still leak private records?
