R

Think in columns, vectors and statistical models

THE MENTAL MODEL

Operate on a whole column instead of one number at a time.

DATA → VECTOR → SUMMARY → PLOT

READ THE CODE

```
scores <- c(10, 20, 30)
average <- mean(scores)
print(average)  # 20
print(scores > 15)
```

FOUR CLUES TO READ IT

<- assigns a value to a name.

c(...) combines values into a vector.

mean calculates an average.

scores > 15 compares all vector elements.

WHAT MAKES IT DIFFERENT

Vectorized operations make statistical exploration concise.

Rich ecosystem for analysis, visualization and research workflows.

WHERE IT FITS

Statistics, research, exploratory data analysis, reporting.

WATCH OUT

Missing values (Not Available, NA) and vector recycling can surprise beginners.

TRY ALONE • 60 SEC

Change a score to 90. Predict the mean and the comparisons.
